SKILLS & PROFICIENCIES

Program management, early-stage project ramping, product engineering, process development — Machine-learning, optimization, numerical methods, data science — Bring-up, operation, and maintenance of manufacturing machinery, analytical instrumentation, and electronic equipment — Python, C++, web app development, Docker/Kubernetes, Unix/Bash

EDUCATION

- **University of California Berkeley**
Ph.D., Mechanical Engineering; May 2026
M.S., Mechanical Engineering; Dec. 2024
M.Eng., Materials Science & Engineering; May 2022
- **Harvey Mudd College**
B.S. Physics; May 2018
B.S. Chemistry; May 2018

RESEARCH & INDUSTRY EXPERIENCE

- **DFM R&D Engineer – Advanced Simulation, Data & AI** Cupertino, CA
Apple Inc. *April 2026 - Present*
 - Developed FEA models for various stakeholders in the Design for Manufacturing (DFM) organization.
 - Developed the Component Characteristics Database to serve cross-functional team needs for component-level material characterization to inform FEA modeling.
 - Built the Semiconductor Manufacturing Hub from the ground up – a web-based multi-purpose tool for data visualization, analysis, reporting, and generative AI application.
- **Ph.D. Intern, Design for Manufacturing**, Apple Inc. *February 2025 - August 2025*
 - Developed a web app for automated gathering, visualization, manipulation, and live editing of component characteristic information. Experience with OAuth, Snowflake, Flask, Docker, Kubernetes, email automation, and remote FEA simulation.
 - Evaluated 18 machine learning methods for predicting solder joint crack severity from board layout and stackup.
 - Independently ideated a novel method for running high-fidelity system-level FEA simulations in a fraction of the standard computation time by leveraging neural nets and global-local simulation.
- **Senior Product Engineer**, Sakuu Corporation *May 2018 - May 2022*
 - **Program Management** — Single-handedly managed, envisioned, and guided development of a browser-based integrated data management, machine learning, and advanced battery analytics system. Project had a \$300,000 budget and lasted 1.5 years. — Drafted statements of work and consulting agreements. Developed all company safety procedures and SOPs.
 - **Product Engineering** — Experience with powder milling, coin/pouch cell assembly, tape casting, slurry preparation, battery assembly and test, and powder bed 3D printing. — Design of experiment, process development, contract manufacturing. — Point-of-contact for fixing/repairing malfunctioning analytical instrumentation.
 - **People Management** — Daily managed a 10-person team of technicians and associate engineers on the R&D lab floor. — Managed 4 different interns to complete their own independent projects.
 - **Early-stage Project Ramping** — Developed strategy to grow a battery modeling and simulation business unit. Interviewed potential candidates and evaluated commercial finite element software. Defined 5-year scope, objectives, and success metrics. — Onboarded and trained all non-executive, technical staff on techniques, procedures, machinery, instrumentation, and theory until the startup headcount reached 50.
- **Intern, Business Operations Management**, Intel Corporation *June 2022 - May 2023*
 - Streamlined hiring and finance operations within the Developer Software Engineering group by automating 1) headcount reporting, 2) tracking of organization wide OKRs from JIRA data, and 3) generation of new job requisitions using Python Selenium, the PowerBI Javascript API, and Microsoft Power Automate.
- **Graduate Student Researcher**, University of California Berkeley *May 2022 - Present*
 - **Browser App for Composites Discovery, [The Materials Project \(MP\)](#)** — Built an app to recommend composite material components based on user-defined properties for an ultimate material. Public GitHub repo [here](#). — Experience with databases, Python API development, and unit testing. Developed an object-oriented framework in Python which uses, and will be integrated into, the MP API. Tested a suite of optimization techniques and developed faster versions in C and Cython.
 - **Fellow at the AI Institute for Next-Generation Food Systems** — Developed an extensible coupled, nonlinear ODE model for growth of a general crop. Public GitHub repo [here](#). — Developed a ray tracing solver for a digital twin of an indoor farm, optimizing LED configuration for maximum light absorption. Resulted in [publication](#). Public GitHub repo [here](#).
- **Student Assistant, College of Engineering**, University of California Berkeley *May 2022 - Present*
 - **Outstanding Graduate Student Instructor 2024**, Modeling and Simulation of Advanced Manufacturing Processes.
 - **Backend Software Development, Capstone Connect** — Automated optimal matching based on mutual ranking between industry sponsors and Masters of Engineering students, who must complete a capstone project to graduate, and automated all document production and email communication. — All work done in Google AppScript (Javascript).
 - **Head Student Staff Assistant, [Dubai Electricity and Water Authority](#) (DEWA)** — Administered the engineering certificate program for students at DEWA through the UC Berkeley Extension. Organized student enrollment, grading, forums, and course resources. — Managed many stakeholders: the program manager and program director from DEWA, the UC Berkeley registrar, staff from the UC Berkeley Extension office, professors, and teaching assistants.
